Data and Analysis

1. Experimental Design

The study was conducted to achieve two primary objectives:

- To validate the relevance and prevalence of the identified problem
- To evaluate the effectiveness of the proposed MVP solution

A total of 30 participants with prior experience using food delivery platforms such as Zomato were included in the study.

The experiment was conducted in two phases:

- Phase 1: Pre-experiment (problem validation)
- Phase 2: Post-experiment (solution evaluation)

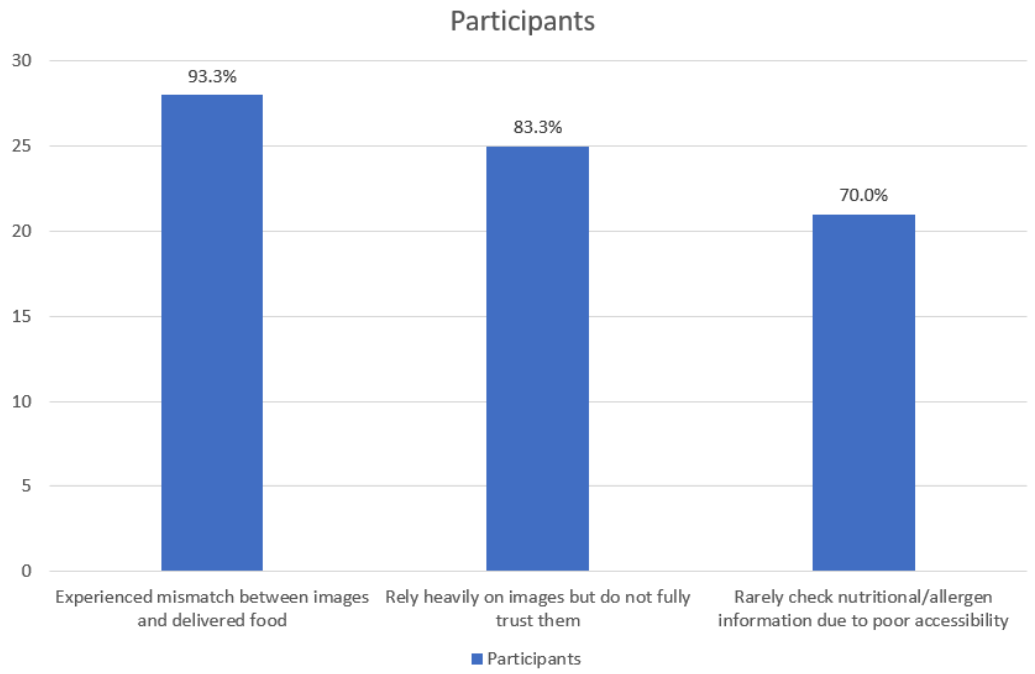
2. Pre-Experiment Data (Problem Validation)

Participants were asked about their past experiences with food delivery applications, focusing on:

- Mismatch between displayed images and delivered food
- Reliance on images for ordering decisions
- Accessibility of nutritional and allergen information

2.1 Observed Data

Observation	Participants	Percentage
Experienced mismatch between images and delivered food	28/30	93.3%
Rely heavily on images but do not fully trust them	25/30	83.3%
Rarely check nutritional/allergen information due to poor accessibility	21/30	70.0%



2.2 Analysis

The data indicates that:

- A significant majority of users have experienced inconsistencies between food images and actual delivery, confirming the existence of a widespread trust gap
- Although users depend on images for decision-making, there is a lack of confidence in their accuracy
- Nutritional and allergen information, while sometimes available, is underutilized due to poor visibility or accessibility

These findings establish that the problem is not theoretical but grounded in real user experience.

---

3. Post-Experiment Data (Solution Evaluation)

Participants were introduced to the MVP prototype and allowed to freely navigate through:

- Food listing pages

- Item detail pages
- Review sections

No task-based instructions were provided to ensure natural interaction. After exploration, participants rated the interface on clarity, reliability, and usefulness using a scale of 1 to 10.

3.1 Observed Data

Metric	Result
Average Rating	8.6 / 10
Ratings ≥ 8	24/30 (80%)
Ratings between 6 and 7	5/30 (16.7%)
Ratings below 6	1/30 (3.3%)

3.2 Qualitative Observations

- The redesigned interface was perceived as more transparent and informative compared to existing platforms
- The “Photos by Restaurant” section was consistently identified as the most reliable component
- Participants preferred real images despite lower visual appeal compared to generic promotional images
- Some users reported initial cognitive load due to increased information density

4. Comparative Analysis

Dimension	Existing Systems	MVP Prototype
Image Reliability	Low	High
User Trust	Moderate	High
Decision Confidence	Moderate	High
Information Clarity	Low–Moderate	High

5. Key Insights

1. Expectation mismatch is highly prevalent, with the majority of users reporting discrepancies between images and delivered food
2. Visual trust is a primary factor influencing user decision-making, yet current implementations fail to establish sufficient credibility
3. The MVP significantly improves perceived trust, usability, and clarity, as reflected in both quantitative ratings and qualitative feedback
4. Users demonstrate a clear preference for authenticity over aesthetics, indicating that accurate representation is more valuable than visually optimized content
5. Increased information availability enhances transparency but must be balanced to avoid cognitive overload

---

6. Limitations

- The sample size is limited to 30 participants
- Findings are based on user perception rather than real behavioral or transactional data
- Evaluation was conducted on a prototype rather than a live production environment

---

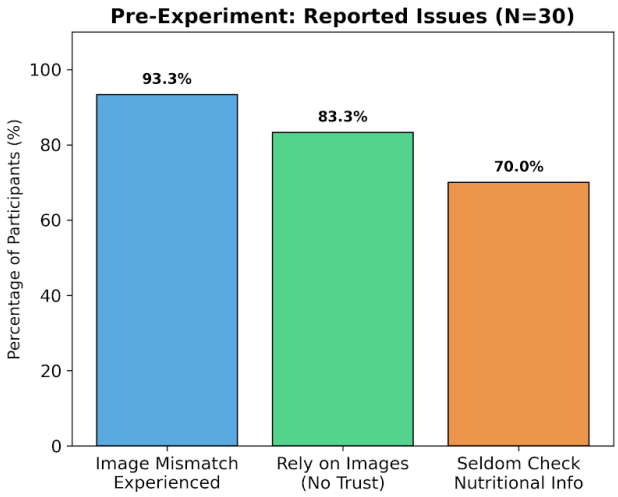
7. Conclusion

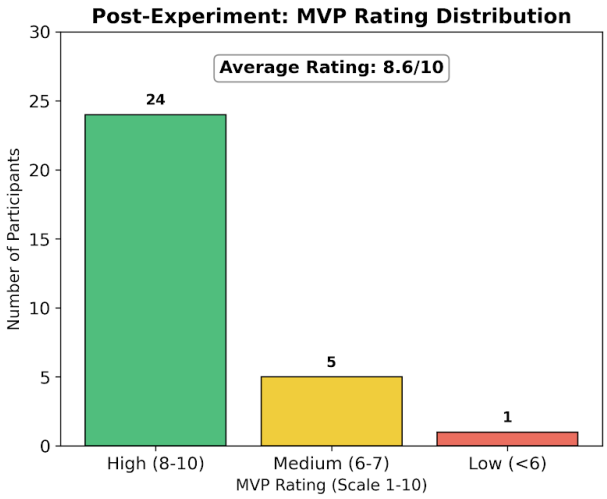
The data confirms both the existence of a significant trust gap in current food ordering interfaces and the effectiveness of the proposed solution.

The introduction of restaurant-specific images and improved information structuring has the potential to:

- Enhance user trust
- Improve decision confidence
- Reduce expectation mismatch

These results support prioritizing visual authenticity as a key factor in improving the overall user experience.





Category	Metric / Observation	Value	Insight
Pre-Experiment	Mismatch between images and delivered food	28/30 (93.3%)	Indicates widespread expectation mismatch
Pre-Experiment	Users rely on images but do not fully trust them	25/30 (83.3%)	Shows presence of trust gap
Pre-Experiment	Users rarely check nutritional/allergen information	21/30 (70.0%)	Information exists but lacks visibility/usability
Post-Experiment	Average interface rating	8.6 / 10	Strong overall acceptance of solution
Post-Experiment	Ratings ≥ 8	24/30 (80%)	Majority found interface highly effective
Post-Experiment	Ratings between 6–7	5/30 (16.7%)	Moderate acceptance among some users
Post-Experiment	Ratings < 6	1/30 (3.3%)	Minimal dissatisfaction
Qualitative	Photos by restaurant considered most reliable feature	High	Visual authenticity drives trust

Category	Metric / Observation	Value	Insight
Qualitative	Real images preferred over generic images	High	Users value accuracy over aesthetics
Qualitative	Interface perceived as more transparent and informative	High	Improved clarity and usability
Qualitative	Some users reported information density	Moderate concern	Need to balance information vs simplicity
Comparative	Image reliability (existing vs MVP)	Low → High	Significant improvement in trust
Comparative	User trust (existing vs MVP)	Moderate → High	Enhanced confidence in decisions
Comparative	Decision confidence (existing vs MVP)	Moderate → High	Better conversion potential
Comparative	Information clarity (existing vs MVP)	Low–Moderate → High	Improved discoverability and usability
